Backup & Disaster Recovery

Protect your data.
Protect your business.

SMB Disaster Preparedness Survey

By Applied Research

- Have A Plan
- No Plan/Intend To Create Plan
- No Plan/No Intention to Create Plan

50% of SMB's Have No Backup and Disaster Recovery Plan

Out of those who have a plan:

- ◆ Half implemented a plan following an outage or loss
- ◆ Only 28% have actually tested their plan

Why Don't SMB's Have A BDR Plan?

The Average SMB Experienced 6 Outages in 2010

Top Reasons For Downtime:

- ◆ Cyber Attacks
- ◆ Power Outages
- ◆ Hardware Failure

The Cost of Downtime

- ◆ Downtime is expensive for SMB's: \$12,500 per day
- ◆ SMB downtime impacts SMB customers: \$10,000 per day
- ◆ 44% of SMB customers have had an SMB vendor temporarily shut down
- ◆ 29% of SMB Customers lost "some" or "a lot" of data as a result of SMB vendor downtime
- ◆ An overwhelming 54% of SMB customers switched vendors due to unreliable computer systems

Issues Among SMB's Who Do Backup...

- ◆ Half Backup only 60% of their data
- ◆ Less than half back up weekly or more frequently
- ◆ Only 23% backup daily
- ◆ 31% don't backup email
- ◆ 21% don't backup applications
- ◆ 17% don't back up customer data

Tape Backup

- Magnetic tape recovery failure rates between 41-72%
- Media environmental sensitivity
- Manual administration of tape library, backup and off-site storage, and media rotation begs human error
- Allows only sequential data access rather than random access afforded by disk - straight backup
- Storage of large amounts of data requires large amounts of space
- Backup speed

What's your plan?

Strategic Considerations

- ◆ How will you continue operating in the event of a temporary outage, data loss or complete failure of your IT systems?
- ◆ What elements of your IT systems are most critical to operations?
 - ◆ Email
 - ◆ Documents
 - ◆ Customer Data
 - ◆ Applications

Strategic Considerations

- ◆ What are your risks?
 - ◆ Hardware Failure
 - ◆ Theft/Malicious Destruction
 - ◆ Power Outages
 - ◆ Fire/Flood/Natural Disaster
 - ◆ Human Error

Tactical Considerations

- ◆ What's your maximum allowable downtime?
- ◆ How quickly must your data be retrieved and mounted or restored?
- ◆ How and where should your data be stored?
- ◆ How do you ensure your plan actually works?

Variables

- ◆ How much data do I have?
- ◆ How quickly does my data grow?
- ◆ How frequently does my data change?
- ◆ What level of retrievability do I consider necessary?
- ◆ What level of retrievability would I find convenient?

We've Got Solutions

Basic BDR Features

- ◆ Local Backup
 - ◆ Automated backup to on-site device.
- ◆ Off-site Backup
 - ◆ Automated backup and synchronization to Bi-coastal SAS70 Type II data centers.
- ◆ Data Deduplication & Local Compression
 - ◆ Reduces storage and bandwidth requirements by eliminating redundant data.

Advanced BDR Features

■ ZFS Snapshots

- Snapshots of the local filesystem which provide easy access to previously stored versions of data. Daily snapshots are stored off-site at Bi-coastal SAS70 Type II data centers.

■ Local/On-site Virtualization

- Stored images of the server environment on the local device which can be mounted following hardware failure or disaster bringing critical systems up an running.

■ Off-site Virtualization

- Images of the server environment which are stored at off-site data centers and can be mounted following hardware failure or disaster to bring critical systems up an running.

Advanced BDR Features (continued)

■ Screenshot Verification of Backups

- This true verification of your backups actually boots your backup and returns a screenshot as evidence that the file booted successfully.

■ Message-level Exchange Recovery

- The ability to drill down to the mailbox and message-level to retrieve email in and exchange environment.

■ Granular SharePoint Recovery

- Allows for direct recovery of a single SharePoint document, collection or folder.

■ SQL Object Recovery

- Allows for direct recovery of SQL database objects.

Simple. Flexible. Affordable.

SERIES

Simple. Flexible. Affordable.

- Simple Automated Local Backup
- Simple Automated Off-site Backup
- Nine model configurations - From 250GB to 5TB
- Optional Raid Configuration
- Three Software Bundling Options
- Works with any Software
- Snap2VM Option adds Instant Off-site Virtualization Feature
- Compatible with Windows, Mac or Linux
- Data Deduplication & Local Compression
- AES 256 + SSL Key-based Encryption
- Affordably Priced for SMB's
